# E.Z Surgical Wire™

**For the subcutaneous soft tissue dissection**

## What is “E.Z Surgical Wire™”?

“E.Z Surgical Wire™” is using the specially designed wire to improve the effect of the surgical treatment for deep folds or scars of the face and body.

Normally, deep wrinkles or scars on skin surface affect the subcutaneous soft tissue, EZ Surgical Wire™ would dissect only the subcutaneous layer without any harm on the skin. After dissection of the subcutaneous layer, epidermis is uplifted and the wrinkles and scars disappeared on the epidermis layer.

This subcutaneous soft tissue dissection using the E.Z Surgical Wire™ is a non-traumatic conservative procedure under local anesthesia, technically simple and cost-effective, which leaves no visible marks on the skin surface.

## The Advantage of “E.Z Surgical Wire™”

- Any deep wrinkles or scars can be improved selectively without any injury of surrounding tissue.
- Surgery time is 10-20 minutes under local anesthesia.
- There will be no scar or trace on the skin surface, so patient won't feel any inconvenience.
- The procedure may be done as a sole intervention or during other cosmetic surgeries (e.g. with Hans E.Z Lift or MIFL; Minimal Incision Forehead Lift) with the aim of improving the results so that it's available for various defects to solve efficiently and flexibly.

## How can E.Z Surgical Diamond Wire remove the wrinkle?

The intervention is performed after antiseptic treatment and local anesthesia with 1% lidocaine.
